Abstract: This paper presents a comparative analysis of $2 \times 2$ antenna array of rectangular topology, U-slot and E-slot microstrip patch antenna array. The operating frequency of array is 2 to 4 GHz. The antenna arrays have been designed and simulated on Rogers RO4350 (tm) substrate with a dielectric constant of 3.66. This paper presents that, the performance of antenna array is improved after the slot cutting in the patch of antenna. The design is analyzed by FEM based HFSSv11 by which return loss, 3D polar plot, VSWR, gain and radiated power of the antenna arrays are computed. The software simulated results shows that the E slot antenna array provides good performance as compared to U slot antenna array and rectangular patch antenna array with the return loss value of $-36.082\text{dB}$ at 2.41GHz and VSWR value $0.2727$ at the same frequency.

Keywords: Microstrip patch antenna, HFSS, return loss, VSWR, 3D polar plot, gain, directivity.

I. INTRODUCTION

Antennas play a very important role in modern communication systems, as they are the most important components to create a communication link. Microstrip patch antennas are widely used in communication systems because of, they are low profile, of light weight, of low volume, having low fabrication cost, conformal design, low power handling capacity, can be easily integrated with microwave integrated circuits (MICs), supports linear as well as circular polarization. They can be designed in a variety of shapes in order to obtain enhanced gain and bandwidth [1].

Antenna array is a set of multiple connected antennas and arranged in a regular structure to form a single antenna. Phased array antenna is a multiple antenna system in which the direction of maximum transmission or reception can be altered by electrical switching means. In these arrays, the radiated energy is highly concentrated in a particular direction and strongly suppressed for other directions [2].

The major advantages of antenna arrays are:

- An antenna array can achieve higher gain and directivity, than could be achieved by a single antenna.
- Arrays can be used to give path diversity (also called MIMO) by exploiting multipath propagation to multiply link capacity.
- They can be used for interference suppression and to achieve many other signal processing functions like spatial filtering, target tracking etc.
- Arrays are generally used for radio direction finding (RDF) [3], [4].

Slot antennas are widely used in radar and satellite communications, which is an application of S band spectrum. Slotted antennas are generally used at UHF and microwave frequencies. A slot antenna's main advantages are its size, design simplicity and it is capable of dual and triple frequency operations.

The proposed antenna array is suitable for various modern wireless communication system applications like WiMax Services, RADAR, fixed satellite services operating in the frequency range of 2-4 GHz where antenna with low profile, small size, light weight and broad pattern is required.

II. DESIGN CONSIDERATIONS

The above design considerations are same for all the three antenna arrays. These values are calculated by finite element modeling (FEM). Finite element modeling (FEM) is a powerful computational technique or we can say, a numerical method, to attain the solution of differential and integral equations [5],[6]. FEM models provide good results in quick time with accurate solutions by solving multiple differential equations using piecewise approximation [7].
A. Design of rectangular microstrip patch antenna array

![Fig.1: 2×2 Rectangular microstrip patch antenna array design (original image from HFSSv11)](image)

The above figure represents 2×2 rectangular microstrip patch antenna array design. The method used to analyze antenna is FEM (Finite Element Modeling) and the feeding technique used is Probe Feeding. The spacing between elements is 5mm.

Simulation results using HFSS:
The below figures represent various results like Return loss, VSWR, 3D Polar plot, radiation pattern during simulation-

1) Return loss:

![Fig.2: Return loss of 2×2 rectangular microstrip antenna array](image)

Figure 2 represents the return loss of -19.5811db at the frequency of 4 GHz.

2) VSWR:

![Fig.3: VSWR of 2×2 rectangular microstrip antenna array](image)

Figure no.3 represents the VSWR of 1.8297 for the corresponding frequency of 4GHz.

3) 3D Polar plot:

![Fig.4: 3D polar plot of 2×2 rectangular microstrip antenna array](image)

The above figure represents the gain of 1.6355 dB for the rectangular patch antenna array.

4) Radiation pattern

![Fig.5: Radiation pattern of 2×2 rectangular microstrip antenna array](image)
B. Design of U slot microstrip patch antenna array

The value of VSWR corresponding to the frequency of 2.39GHz is 0.3802 which is a much improved value as compared to VSWR of rectangular microstrip patch antenna array.

3) 3D polar plot:

This figure represents the value of gain attained by U slot microstrip patch antenna array which is 5.013 dB. This value is very high as compared to the gain attained by rectangular patch microstrip antenna array.

4) Radiation pattern:

The simulation result shows that the performance of antenna array improves after cutting a U slot in each antenna of the array.
C. Design of E slot microstrip patch antenna array

Simulation results using HFSS:

1) Return loss:

![Fig.11: 2x2 E slot microstrip antenna array design](image1)

Fig. 11: 2x2 E slot microstrip antenna array design

![Fig.12: Return loss of 2x2 E- slot microstrip patch antenna array](image2)

Fig. 12: Return loss of 2x2 E-slot microstrip patch antenna array

The above figure represents the value of return loss for 2x2 E slot microstrip patch antenna array design and it is equal to -36.082 db at 2.41 GHz.

2) VSWR:

![Fig.13: VSWR of 2x2 E-slot microstrip patch antenna array](image3)

Fig. 13: VSWR of 2x2 E-slot microstrip patch antenna array

The value of VSWR corresponding to the frequency of 2.41 GHz is 0.2727 which is an improved value as compared to VSWR of U slot microstrip patch antenna array.

3) 3D Polar plot:

![Fig.14: 3D Polar plot of 2x2 E slot microstrip antenna array](image4)

Fig. 14: 3D Polar plot of 2x2 E slot microstrip antenna array

This figure represents the value of gain attained by E slot microstrip patch antenna array which is 5.855 dB.

4) Radiation pattern:

![Fig.15: Radiation pattern of 2x2 E slot microstrip patch antenna array](image5)

Fig. 15: Radiation pattern of 2x2 E slot microstrip patch antenna array

The simulation results indicate that 2x2 E slot antenna array has better performance in terms of return loss, VSWR, gain and directivity as compared to 2x2 U slot microstrip antenna array. Here, with the help of a comparison table, a comparison is made between the three arrays performance parameters such as return loss, VSWR, gain and radiated power.

<table>
<thead>
<tr>
<th>Performance Parameters</th>
<th>Rectangular patch</th>
<th>U slot</th>
<th>E slot</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return loss (dB)</td>
<td>-19.5811</td>
<td>-33.1975</td>
<td>-36.082</td>
</tr>
<tr>
<td>VSWR</td>
<td>1.8297</td>
<td>0.3802</td>
<td>0.2727</td>
</tr>
<tr>
<td>Gain (dB)</td>
<td>1.6355</td>
<td>5.013</td>
<td>5.855</td>
</tr>
<tr>
<td>Radiated power (W)</td>
<td>0.0784</td>
<td>0.9185</td>
<td>0.9563</td>
</tr>
</tbody>
</table>

The comparison table shows that E slot antenna array has better results than U slot and rectangular patch antenna array.
III. COMPARISON GRAPHS:

\[ \text{Return loss (dB)} \]

- Rectangular patch (without slot)
- U slot
- E slot

**Fig. 16:** Showing variation in the return loss values of the three antenna arrays

\[ \text{Radiated power (W)} \]

- Rectangular patch (without slot)
- U slot
- E slot

**Fig. 19:** Showing variation in the radiated power of the three antenna arrays

IV. CONCLUSION

In this paper, a comparative analysis of the three antenna arrays having the same size and design considerations, is presented. The simulation results indicate that the E slot antenna array has better results as compared to rectangular patch antenna array and U slot antenna array. E slot antenna array has return loss value -36.082 dB at 2.41 GHz, VSWR value is 0.2727 and gain is 5.855 dB.
